## Local Easter Festivities

We're thrilled for the exciting changes under construction here at Keeneland! As we continue to make enhancements to our facilities to ensure a top-notch experience for all our visitors, we've decided to temporarily pause our Keeneland Easter Egg Hunt. Rest assured, the im-

provements will not impact Keeneland's current race meet or the operations of our Thoroughbred auctions. We hope to see you during the Spring Meet and look forward to seeing you at our summer events.

In the meantime, we invite you to explore the delightful Easter festivities offered by our local Kids Club partners!

## Shaker Village

Hippity Hoppity! Spring means warmer weather, blooming flowers and an epic Easter Egg Hunt with our friends at Shaker Village in Harrodsburg, Ky! Join the fun on Saturday, March 30 with this egg-citing event for kids under 12. You'll meet baby farm animals, make crafts, hop on pony rides and collect lots of candy. Food trucks will be onsite, and adults can enjoy drinks from the bar. Grab tickets now before they disappear!

## Crafts with the Explorium

**DIY BORAX CRYSTALS**

**MATERIALS**

- Mason Jar
- 8 tbs Borax
- 2 cups water (hot)
- Pipe cleaner
- String
- Craft stick

**PROCEDURE**

1. Wrap the pipe cleaner around itself until it forms a little ball or any other shape.
2. Tie a string to the pipe cleaner shape.
3. Tie the other end of the string to the craft stick.
4. Pour the Borax into the mason jar.
5. Pour warm or hot water into the mason jar.
6. Stir the borax and water until the borax is completely dissolved.
7. Place the pipe cleaner shape into the jar so that it is suspended in the middle of the liquid using the popsicle to hold the shape in place by laying it across the top of the jar.
8. Check back in 5-8 hours and remove the crystals from the jar and dry them off.

**HOW DOES IT WORK?**

Borax is an example of crystal – “a solid with flat sides and a symmetrical shape because its molecules are arranged in a unique, repeating pattern.” Every crystal has a repeating pattern based on its unique shape. They may be big or little, but they all have the same “shape”.

Hot water holds more borax crystals than cold water. That’s because heated water molecules move farther apart, making room for more of the borax crystals to dissolve. When no more of the solution can be dissolved, you have reached saturation. As this solution cools, the water molecules move closer together again. Now there’s less room for the solution to hold onto as much of the dissolved borax. Crystals begin to form and build on one another as the water lets go of the excess and evaporates.
